# E-tiGo: Ride Pricing and Reward Points

How fares and reward points are calculated, as currently built · Updated 15 October 2026

## Part 1: Ride pricing

### How prices are set

Each city and vehicle class has its own pricing settings, managed in the admin dashboard. A change is saved as a new version with a start date. Rides that are already booked keep the rates they were quoted. The rates below are the recommended starting rates for Abuja and Lagos; the live rates are whatever is set in the dashboard.

| Setting | What it does | Economy | Comfort | Premium |
|---|---|---|---|---|
| Base fare | Fixed charge on every trip | ₦600 | ₦800 | ₦1,200 |
| Per-km rate | Charged for each km of the route | ₦250 | ₦350 | ₦500 |
| Per-minute rate | Charged for each minute of the trip | ₦40 | ₦55 | ₦80 |
| Minimum fare | The fare never goes below this | ₦1,500 | ₦2,000 | ₦3,000 |
| Waiting rate | Per minute waited after the free period | ₦50 | ₦65 | ₦100 |
| Free waiting | Grace period at pickup | 5 min | 5 min | 5 min |

### The formula

```
Trip charge   = Base fare + (km × per-km rate) + (trip minutes × per-minute rate) + Waiting
Waiting       = (minutes waited − free minutes) × waiting rate   (never below 0)
Metered fare  = the higher of Trip charge and Minimum fare
Final fare    = Metered fare × Surge − Tier discount
Tier discount = Base fare × rider's tier %   (never more than the fare)
```

### Surge and tier discount

- **Manual:** switched on by an admin.
- **Time-based:** set days and hours in the city's local time, e.g. weekday rush hour.
- **Demand-based:** applies when ride requests in the last 10 minutes, divided by free drivers, reach the rule's ratio (and there are at least 5 requests).
- If several rules apply, the highest-priority rule wins; on a tie, the higher multiplier wins.
- **Tier discount** off the base fare: Bronze 0%, Silver 2%, Gold 5%, Platinum 10%, Diamond 15%.

### Upfront fares

As on Uber and Bolt, the rider pays the quote; Google's travel time already allows for normal traffic. It changes only for waiting past the free minutes, or a trip that runs more than 25% (and at least 10 minutes) longer than quoted: then the actual trip time is billed, capped at 3× the quoted time so a trip left running can't run up the fare. A quicker trip still pays the quote.

### Example: Abuja Economy · 10 km · 25 min · 8 min wait · 1.5× surge · Gold

| Item | Calculation | Amount |
|---|---|---|
| Base fare | | ₦600.00 |
| Distance | 10 km × ₦250 | ₦2,500.00 |
| Time | 25 min × ₦40 | ₦1,000.00 |
| Waiting | (8 − 5 free) = 3 min × ₦50 | ₦150.00 |
| Trip charge | Above the ₦1,500 minimum, so it stands | ₦4,250.00 |
| Surge | × 1.5 | ₦6,375.00 |
| Gold discount | 5% of ₦600 base fare | − ₦30.00 |
| **Final fare** | | **₦6,345.00** |

Without surge, waiting or a discount, the same trip is **₦4,100**. A 0.3 km, 2-minute trip works out at ₦600 + ₦75 + ₦80 = ₦755, so the rider pays the ₦1,500 minimum.

# Part 2: Reward points

## How it works

Riders don't earn a flat number of points per km. They earn points for the $CO_2$ they save compared with an average private car (120 g of $CO_2$ per km). The longer the trip and the cleaner the vehicle, the more points they get.

```
CO2 saved (kg) = distance (km) × (120 − vehicle g/km) ÷ 1000
Base points    = CO2 saved (kg) × 10, rounded (minimum 5)
Final points   = base points × bonus multiplier
```

## Points per km by vehicle class (before bonuses)

| Vehicle class | Emission (g $CO_2$/km) | $CO_2$ saved per km | Points per km |
|---|---|---|---|
| Economy | 65 | 55 g | **0.55** |
| Comfort | 80 | 40 g | **0.40** |
| Premium | 95 | 25 g | **0.25** |
| Other / unrecognised class | 75 | 45 g | **0.45** |
| Electric (EV) | 0 | 120 g | **1.20** |

## Bonus multipliers

Bonuses add together rather than multiply: each one adds its extra on top of 1×.

| Bonus | Multiplier | Effect |
|---|---|---|
| Electric vehicle ride | 2.0× | EV earns 2.4 points per km |
| Off-peak (10pm – 6am, city local time) | 1.25× | +25% on any ride |
| EV + off-peak | 2.25× | EV earns 2.7 points per km |

## Worked examples

| Trip | Calculation | Points |
|---|---|---|
| 10 km Economy, daytime | 10 × 0.55 = 5.5, rounded | **6** |
| 20 km Comfort, daytime | 20 × 0.40 = 8 | **8** |
| 10 km EV, daytime | 10 × 1.20 = 12, × 2.0 | **24** |
| 10 km EV, 11pm | 12 × 2.25 | **27** |
| 3 km Economy, daytime | 1.65 → raised to the 5-point minimum | **5** |
| 3 km EV, daytime | minimum 5, × 2.0 | **10** |

Every completed ride earns at least 5 points. An Economy ride needs about 9 km before it earns more than the minimum. The minimum is applied before bonuses.

## Points to confirm

- A **Shared Journey** bonus (1.5×) is ready for when shared rides launch in Phase 2. Until then it isn't awarded, and the admin panel marks it as not yet active.
- The distance charged is the quoted route. There's no GPS trail yet, so a detour the rider asks for isn't billed.
- The emission figures are general industry averages, not E-tiGo fleet data, and haven't been confirmed.
- Pricing rates, surge rules, tier discounts and bonus multipliers are all edited in the admin dashboard. The emission figures, the 10 points per kg rate, the 5-point minimum and the upfront-fare limits (25%, 10 minutes, 3×) are server settings. None of these needs a new app release.
