

Fleet Management Feature — Developer Handoff

Date: 9 October 2026 **Backend Status:** Phase 1 Complete (API ready for integration) **For:** Designer, Frontend, and Mobile Teams

What Was Built

E-tiGo now supports **internal fleet vehicles** with a **hire-to-own** model. Fleet drivers use E-tiGo-owned vehicles and pay a daily remittance toward eventual ownership. This is the standard Nigerian fleet/taxi model (same as Bolt fleet partners).

The Remittance-First Model

Every ride a fleet driver completes, the fare is split in real-time:

```
Daily Target: ₦40,000

Ride 1: ₦3,200 fare → ALL to E-tiGo (₦3,200/40,000) |
Ride 2: ₦5,800 fare → ALL to E-tiGo (₦9,000/40,000) |
...
Ride 9: ₦6,000 fare → ALL to E-tiGo (₦38,000/40,000) |
Ride 10: ₦5,500 fare →
    ₦2,000 to E-tiGo (target met ✅)
    ₦3,500 to DRIVER

After target met:
Ride 11: ₦4,200 → ALL to driver
Ride 12: ₦3,800 → ALL to driver
```

Key concept: The driver earns ₦0 until the daily target is met. After that, every fare is 100% theirs. No commission is charged to fleet drivers — E-tiGo's revenue comes entirely from the daily remittance.

API Endpoints Available

Base URL: `{APP_URL}/api/v1`

Driver Endpoints (3)

These are what the **mobile app** consumes.

1. Today's Remittance Progress

```
GET /driver/remittance/today
Authorization: Bearer {driver_token}
```

Returns the real-time remittance progress for today. This is the primary data source for the driver's daily dashboard.

Response fields:

Field	Type	Description
target_amount	string (decimal)	Daily target, e.g. "40000.00"
remitted_amount	string (decimal)	Amount collected toward target so far
shortfall_amount	string (decimal)	How much is still needed (target - remitted, 0 if met)
target_met	boolean	true once daily target is fully met
target_met_at	datetime / null	Timestamp when target was met
ride_count	integer	Number of rides completed today
total_fares	string (decimal)	Sum of all ride fares today
driver_earnings	string (decimal)	What the driver has earned AFTER target was met

Returns `{"remittance": null}` if the driver has no active fleet agreement.

2. Remittance History

```
GET /driver/remittance/history
Authorization: Bearer {driver_token}
```

Paginated list of daily remittance records, most recent first. Same fields as today's endpoint, plus `settled` (boolean) and `date`.

Standard pagination via `meta` block (`current_page` , `last_page` , `per_page` , `total`).

3. Fleet Agreement

```
GET /driver/fleet-agreement
Authorization: Bearer {driver_token}
```

Returns the driver's active fleet agreement summary.

Response fields:

Field	Type	Description
daily_remittance_target	string (decimal)	The daily amount they need to remit
total_remitted	string (decimal)	Total amount remitted across all days
progress_percentage	float	0-100, progress toward vehicle ownership
agreement_start_date	date string	When the agreement started
status	string	active, paused, completed, terminated
shortfall_streak_days	integer	Consecutive days where target was not met
vehicle	object	Vehicle details (make, model, plate, etc.)

Important business rule: The driver does NOT see `total_vehicle_cost` or `remaining_amount` . They see only the percentage progress. This is a deliberate business decision.

Returns `{"agreement": null}` if no active fleet agreement.

Admin Endpoints (7)

These are what the **admin dashboard/frontend** consumes.

Method	Endpoint	Description
GET	/admin/fleet-agreements	List all agreements (filter by status, driver_id)
POST	/admin/fleet-agreements	Create new agreement
GET	/admin/fleet-agreements/{id}	Agreement detail + last 30 remittance records
PUT	/admin/fleet-agreements/{id}	Update daily target (active only)
POST	/admin/fleet-agreements/{id}/terminate	Terminate with reason
POST	/admin/fleet-agreements/{id}/pause	Pause (e.g., vehicle maintenance)
POST	/admin/fleet-agreements/{id}/resume	Resume paused agreement

Admin responses include **all** financial fields (`total_vehicle_cost` , `remaining_amount`) — these are hidden from drivers.

Creating an Agreement (Admin Flow)

- 1. Mark a vehicle as fleet: `PATCH /admin/drivers/{driver_id}/vehicle/fleet`
- 2. Create the agreement: `POST /admin/fleet-agreements` with:
 - `driver_id` (UUID)
 - `vehicle_id` (UUID, must be `is_fleet: true`)
 - `daily_remittance_target` (number, min 1000)
 - `total_vehicle_cost` (number, min 100000)
 - `agreement_start_date` (date, today or future)

A driver can only have **one active agreement** at a time.

UI/UX Guidance

Driver App — Screens Needed

1. Daily Remittance Dashboard (Primary Screen for Fleet Drivers)

This should be prominently visible when the driver is online. Think of it like a fuel gauge.

States to handle:

State	Visual Suggestion
Target not yet met	Progress bar/circle showing <code>remitted_amount / target_amount</code> . Show "¥28,500 of ¥40,000"

Target met	Celebration moment. Switch to "You're earning! ₦X earned so far"
No agreement	Hide the remittance widget entirely — this is a regular (non-fleet) driver

Data to display:

- Progress toward daily target (bar, circle, or percentage)
- Number of rides completed today
- Amount still needed: `shortfall_amount`
- Driver earnings (only meaningful after target met)
- Time target was met (`target_met_at`) — e.g., "Target met at 2:22 PM"

2. Remittance History

Calendar or list view showing daily records. Each day shows:

- Date
- Target met (yes/no — use checkmark/cross)
- Amount remitted vs target
- Number of rides
- Driver earnings for that day
- Shortfall (if any, highlighted)

Consider colour-coding: green for target met, red/amber for shortfall days.

3. Fleet Agreement Summary

A card or screen showing:

- Vehicle info (make, model, plate)
- Daily remittance target
- Progress toward ownership (percentage — this is the **only** progress indicator, per business rules)
- Agreement status
- Shortfall streak (if > 0, show as a warning)
- Agreement start date

Do NOT show: total vehicle cost, remaining amount, or any absolute naira figure related to vehicle price. Show percentage only.

Admin Dashboard — Screens Needed

1. Fleet Agreements List

Table/list view with columns:

- Driver name
- Vehicle (make + plate)
- Daily target
- Total remitted / Total cost (admin sees both)
- Progress %
- Status (with colour badges: green=active, yellow=paused, grey=completed, red=terminated)
- Shortfall streak (flag if > 0)

Filters: status dropdown, driver search

2. Fleet Agreement Detail

- All financial data (admin sees everything)
- Recent remittance records (last 30 days shown by default)
- Action buttons: Pause, Resume, Terminate (context-dependent — only show valid actions for current status)
- Audit trail (agreement history)

3. Create Agreement Form

Fields:

- Driver selector (searchable dropdown)
- Vehicle selector (filtered to fleet vehicles only)
- Daily remittance target (number input, default 40000)
- Total vehicle cost (number input)
- Agreement start date (date picker, today or future)

Validation messages to handle:

- "Driver already has an active fleet agreement"
- "Vehicle must be marked as fleet before creating an agreement"

Enum Values

Fleet Agreement Status

Value	Label	Description
active	Active	Agreement is in force, remittance is being tracked
paused	Paused	Temporarily suspended (e.g., vehicle maintenance, driver leave)
completed	Completed	Total vehicle cost fully remitted — ownership transfers
terminated	Terminated	Agreement ended early by admin (with reason)

Key Business Rules to Enforce in UI

1. **Fleet drivers earn ₦0 until daily target is met.** The UI should make this crystal clear — show it as "Working toward today's target" not "Earnings: ₦0".
2. **No vehicle price shown to drivers.** Progress is always shown as percentage (e.g., "25% toward ownership"), never as "₦1,250,000 of ₦5,000,000".
3. **One active agreement per driver.** The create agreement form should validate this and show a clear error if violated.
4. **Fleet vehicles skip plate KYC verification.** When a vehicle is marked as fleet, the KYC flow changes — NIN + Driver's License is sufficient (no plate verification needed since E-tiGo owns the vehicle).
5. **Zero commission for fleet drivers.** The earnings display should NOT show any commission deduction line. Fleet drivers see only: remittance vs. personal earnings.
6. **Agreement auto-completes.** When `total_remitted >= total_vehicle_cost`, the agreement status automatically changes to `completed`. The driver should see a congratulatory state.

What's NOT Built Yet

Feature	Why	Impact on UI
Ownership transfer workflow	Awaiting Chairman meeting decision (Q8)	Don't build a "Transfer ownership" button yet
Grace period auto-escalation	Grace period duration not decided (Q2)	Shortfall streak is tracked but no automated actions happen yet
Vehicle swap endpoint	Deferred — admin can manually terminate + recreate	No "Swap vehicle" button needed yet
Daily settlement cron	Reset time not decided	Data is accurate but settled flag won't flip automatically yet
Shortfall alert notifications	Depends on Q2	No admin notifications for shortfall streaks yet

Testing

Postman Collection

Import `doc/postman_collection.json` — new folders:

- **Admin — Fleet Agreement Management** (8 requests with example responses)
- **Driver — Fleet Remittance** (3 requests with example responses for all states)

Postman Variables Needed

Variable	Description	Example
<code>admin_token</code>	Admin auth token	From admin login
<code>driver_token</code>	Driver auth token	From driver OTP verify
<code>fleet_agreement_id</code>	UUID of a fleet agreement	From create or list response
<code>driver_uuid</code>	UUID of a driver	From admin driver list
<code>vehicle_uuid</code>	UUID of a fleet vehicle	From driver vehicle endpoint

Quick Test Flow

1. Login as admin → get `admin_token`
 2. Login as driver → get `driver_token`
 3. Mark vehicle as fleet: PATCH `/admin/drivers/{id}/vehicle/fleet`
 4. Create agreement: POST `/admin/fleet-agreements`
 5. Check driver view: GET `/driver/fleet-agreement` (should show agreement)
 6. Check today: GET `/driver/remittance/today` (should be null until a ride happens or remittance is created)
-

Full API Documentation

See `doc/API_REFERENCE.md` — sections:

- **Admin — Fleet Agreement Management**
- **Driver — Fleet Remittance**
- **Enums → Fleet Agreement Status**

All endpoints include request/response schemas with example payloads.

Questions? Ping the backend team. The Postman collection has all endpoints ready for testing.
