

# WhatsApp OTP & Social Auth

## Setup Guide for e-tiGO

This document lists what the development team needs from you (the client / business owner) to enable WhatsApp OTP login and social OAuth for the e-tiGO app.

---

## 1. WhatsApp Business Cloud API

We use Meta's WhatsApp Cloud API to send one-time verification codes to users via WhatsApp.

### *What you need to do*

1. **Create a Meta Business account** at [business.facebook.com](https://business.facebook.com) (if you don't already have one).
2. **Create a Meta App** at [developers.facebook.com/apps/](https://developers.facebook.com/apps/) — select "Business" type.
3. **Add the WhatsApp product** to the app (from the app dashboard, click "Add Product" → WhatsApp).
4. **Complete business verification** — Meta requires this for production access. Go to Business Settings → Security Center → Start Verification.
5. **Register a phone number** — this is the number that will appear as the sender (e.g. your business number). You can use Meta's test number during development.
6. **Create an OTP message template** in the WhatsApp Manager:
  - Name: `otp_verification`
  - Category: Authentication
  - Language: English
  - Body: Your e-tiGO verification code is: `{{1}}`
  - Submit for approval (usually approved within minutes for auth templates).

### *What to send the dev team*

| Variable                 | Where to find it                                                                          |
|--------------------------|-------------------------------------------------------------------------------------------|
| WHATSAPP_PHONE_NUMBER_ID | WhatsApp > API Setup > Phone Number ID                                                    |
| WHATSAPP_ACCESS_TOKEN    | WhatsApp > API Setup > Generate permanent token (or use System User token for production) |
| WHATSAPP_OTP_TEMPLATE    | The template name you created (default: <code>otp_verification</code> )                   |

**Production note:** For production, create a System User in Business Settings, assign it to the WhatsApp app with `whatsapp_business_messaging` permission, and generate a permanent access token. The temporary token from the dashboard expires after 24 hours.

---

## 2. Google OAuth (Sign in with Google)

### *What you need to do*

1. Go to **Google Cloud Console** ([console.cloud.google.com](https://console.cloud.google.com)).
2. Create a project (or use an existing one).
3. Go to **APIs & Services** → **OAuth consent screen** → Configure for "External" users.
4. Go to **APIs & Services** → **Credentials** → Create **OAuth 2.0 Client IDs**:
  - Create one for **Android** (needs your app's package name and SHA-1 fingerprint).
  - Create one for **iOS** (needs your app's bundle ID).
  - Create one for **Web** (if needed for admin panel or testing).

### ***What to send the dev team***

| Variable         | Where to find it                                                        |
|------------------|-------------------------------------------------------------------------|
| GOOGLE_CLIENT_ID | The Web Client ID (or Android — the mobile team will clarify which one) |

## **3. Apple OAuth (Sign in with Apple)**

### ***What you need to do***

1. Go to **Apple Developer Portal** ([developer.apple.com/account](https://developer.apple.com/account)).
2. Under **Certificates, Identifiers & Profiles** → **Identifiers**, register an App ID with "Sign in with Apple" enabled.
3. Under **Keys**, create a key with "Sign in with Apple" enabled. Download the key file.
4. Under **Identifiers** → **Services IDs**, register a Service ID (this is your client ID for server-side verification).

### ***What to send the dev team***

| Variable        | Where to find it                                   |
|-----------------|----------------------------------------------------|
| APPLE_CLIENT_ID | The Service ID identifier (e.g. com.etigo.service) |

## **4. Facebook OAuth (Sign in with Facebook)**

### ***What you need to do***

1. Go to **Meta for Developers** ([developers.facebook.com/apps/](https://developers.facebook.com/apps/)).
2. Use the same app from the WhatsApp setup above (or create a separate one).
3. Add the **Facebook Login** product.
4. Under **Settings** → **Basic**, note the App ID and App Secret.
5. Under **Facebook Login** → **Settings**, add your app's redirect URIs (the mobile team will provide these).

## What to send the dev team

| Variable            | Where to find it              |
|---------------------|-------------------------------|
| FACEBOOK_APP_ID     | Settings → Basic → App ID     |
| FACEBOOK_APP_SECRET | Settings → Basic → App Secret |

## Summary — All env values needed

```
# WhatsApp Cloud API
WHATSAPP_PHONE_NUMBER_ID=your_phone_number_id
WHATSAPP_ACCESS_TOKEN=your_access_token
WHATSAPP_OTP_TEMPLATE=otp_verification

# Google
GOOGLE_CLIENT_ID=your_google_client_id

# Apple
APPLE_CLIENT_ID=com.etigo.service

# Facebook
FACEBOOK_APP_ID=your_facebook_app_id
FACEBOOK_APP_SECRET=your_facebook_app_secret
```

**Send these values securely** — not over plain email. Use a password manager share, or an encrypted channel.
